Isolated NOVX polypeptides and nucleic acids, useful for preventing, diagnosing and treating e.g. cancer, diabetes and Alzheimer's disease N-PSDB; ADN62903.

Claim 1; SEQ ID NO 100; 395pp; English.

The invention relates to isolated NOVX polypeptides and polynucleotides.

NOVX polypeptides and polynucleotides are used to prevent, diagnose or NOVX polypeptides. For example, NOVX polypeptides and activity of NOVX polypeptides. For example, NOVX polypeptides and activity of NOVX by supplementing the patient our control or to rectify mutations. Conversely, antisense NA molecules may be administered to down regulate expression of NOVX polypeptides by indiagnostic assays to detect and quantitate the presence of binding with the cells own genes and preventing their expression. NOVX polymucleotides and complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar sequences in samples, and so which patients may be in need of restorative therapy. NOVX polypeptides may also be used as antigens in the production of antibodies and in assays to identify modulators the production of antibodies and in assays to identify modulators anti-NOVX polypeptide expression and activity of NOVX. The anti-NOVX polypeptide expression and activity of NOVX cused to modulate NOVX polymucleotide expression and activity of NOVX polypeptides and purpose and presence of NOVX in samples. The anti-NOVX polypeptide antibodies may be used as diagnose and treat: metabolic disorders, diaberes, obesity, infectious diseases, anorexia, cancer, cancer, saberes; anobesity, immune disorders, haematopoietic disorders, and the various dyslipidaemias, metabolic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to novel activated immune T cells or dendritic cells directed toward extracellular serine protease termed tumour antigen derived gene-14 (TADG-14). The method of the invention involves exposing the immune cells to a TADG-14 protein fragment, where exposure to the TADG-14 protein fragment activates the immune cells. The invention of activated immune T cells or dendritic cells. The invention allows screening to identify proteases overexpressed in carcinoma. The present sequence is stratum corneum
disturbances associated with obesity, the metabolic syndrome X and wasting disorders associated with chronic diseases and various cancers. They may also be used as antibacterial agents. The present sequence represents the amino acid sequence of a human NOVX protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Production of activated immune cells or dendritic cells by exposing immune cells to tumor antigen derived gene protein fragment consisting

The invention relates to extracellular serine protease termed tumour antigen derived gene-14 (TADG-14) and its nucleic acid. Composition comprising TADG-14 peptide is useful for treating a neoplastic state in individual. The neoplastic state is chosen from ovarian cancer, cancer, lung cancer, colon cancer, prostate cancer in which TADG-14 is overexpressed. The present sequence is Stratum corneum chymotryptic enzyme (scce) catalytic domain. This sequence is used in the envention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel isolated DNA encoding tumor antigen derived gene-14 protein, useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               for treating neoplastic state (such as ovarian cancer, breast cancer, lung cancer, colon cancer, prostate cancer) in an individual.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

QRIKASKSF 9

polypeptide or nucleic acid molecule in a first mammalian subject; (9) a method of identifying an agent that binds to the polypeptide described above; (10) a method for identifying a potential threapeutic agent for use in treating a pathology that is related to an aberrant expression or aberrant physiological interactions of the polypeptide; (11) a method of screening for a modulator of activity or of latency or predisposition to a pathology associated with the polypeptide; (12) a method for modulating the above polypeptide. Now mammal; and [14) a method for producing the above polypeptide. Now sequences have antidiabetic, nortodici, antibacterial, virucide, immunomodulator, cytostatic, noctropic, neuroprotective, antiparkinsonian and antilipaemic activities, and can be used in gene therapy. The polypeptide is useful in manufacturing a medicament for treating a syndrome associated with a human disease. The polypeptide or the nucleic acid molecule may be used to diagnose, treat or prevent metabolic alsorders such as diabetes or obesity, infections, cachexia, cancer, neurodegenerative disorders such as Alzheimer's disease or Parkinson's disease, immune disorders such as Alzheimer's disease or Parkinson's cyclobes, in chromosome mapping, tissue typing, preventive medicine and present invention.

Expresent invention.

```
The present invention describes NOVX proteins, where X can be 1 to 55 described above and a carrier; (2) a kit comprising a polypeptide described above and a carrier; (2) a kit comprising, in one or more containers, the composition described above; (3) an isolated nucleic acid molecule which encodes a NOVX protein of the invention; (4) a vector comprising the nucleic acid molecule described above; (5) a call comprising the above vector; (6) an antibody that immunospecifically binds to the polypeptide described above; (7) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a sample; (8) methods for determining the presence of an order of acid molecule in a disease associated with altered levels of expression of the above
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Smithson G, Millet I, Peyman JA, Kekuda R, Ju J, Li L, Guo X; Patturajan M, Spytek KA, Edinger SR, Ellerman K, Malyankar UM; Ort T, Gorman L, Zerbusen BD, Anderson DW, Zhong M, Catterton E; Ji W, Miller CE, Rastelli L, Stone DJ, Pena CEA, Shenoy SG; Shimkets RA, Rothenberg ME, Leach MD, Agee ML, Berghs C, Dipippo VA; Eisen AJ, Gangolli EA, Rieger DK, Spaderna SK;

metabolic disorder; diabetes; obesity; infection; cachexia; cancer;
neurodegenerative disorder; Alzheimer's disease; Parkinson's disease;
immune disorder; haematopoietic disorder; dyslipidaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 1; Page 171; 586pp; English.

The invention relates to isolated NOVX polypeptides and polynucleotides. NOVX polypeptides and polynucleotides are used to prevent, diagnose or treat a medical condition in human related to the aberrant expression and activity of NOVX polypeptides. For example, NOVX polypeptides and polynucleotides may be used to treat disorders associated with decreased expression or activity of NOVX by supplementing the patient our production or to rectify mutations. Conversely, antisense NA molecules
Isolated NOVX polypeptides and nucleic acids, useful for preventing, diagnosing and treating e.g. cancer, diabetes and Alzheimer's disease.
                                                                                                                                                                                         Claim 1; SEQ ID NO 98; 395pp; English.

may be administered to down regulate expression of NOVX polypeptides by binding with the cells own genes and preventing their expression. NOVX binding with the cells own genes and preventing their expression. NOVX purelectides and complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar sequences in samples, and so which patients may be in need of restorative therapy. NOVX polypeptides may also be used as antigens in the production of antibodies and in assays to identify modulators (agonists and antagonists) of the expression and activity of NOVX. The anti-NOVX polypeptide antibodies, agonists and antagonists may also be used to modulate NOVX polypucleotide expression and activity of NOVX polypeptides. The anti-NOVX polypeptide antibodies may also be used as diagnose and treat: metabolic disorders, diabetes, obseity, infectious disorders, and the various dislipidaemias, metabolic disorders, and the various dislipidaemias, metabolic disorders associated with obseity, the metabolic syndrome X and chisturbances associated with obseity, the metabolic syndrome X and wasting disorders associated with chronic diseases and various cancers. They may also be used as antibacterial agents. The present sequence of a human NOVX protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           human; NOVX; antidiabetic; anorectic; antibacterial; virucide; immunomodulator; cytostatic; nootropic; neuroprotective; antiparkinsonian; antilipaemic; gene therapy; human disease; metabolic disorder; diabetes; obesity; infection; cachexia; cancer; neurodegenerative disorder; Alzheimer's disease; Parkinson's disease; immune disorder; haematopoietic disorder; dyslipidaemia.

The present invention describes NOVX proteins, where X can be 1 to 55 C (e.g. NOV1). Also described: (1) a composition comprising a polypeptide described above and a carrier; (2) a kit comprising, in one or more described above and a carrier; (3) an isolated nucleic acid molecule above; (3) an isolated nucleic acid molecule described above; (5) a cell or comprising the nucleic acid molecule described above; (5) a cell or comprising the nucleic acid molecule described above; (5) a cell or comprising the nucleic acid molecule described above; (5) a cell or presence or amount of the above polypeptide cor nucleic acid molecule in a fasease associated with altered levels of expression of the above or adease associated with altered levels of expression of the above and polypeptide or nucleic acid molecule in a first mammalian subject; (9) a method of identifying an agent that binds to the polypeptide described above; (10) a method for identifying a potential therspeutic agent for above polypeptide cor nucleic acid molecule in a first mammalian subject; (9) a method of identifying an agent that binds to the polypeptide described above; (11) a method of a pathology that the polypeptide; (12) a method for modulating cor a pathology associated with the polypeptide; (12) a method for modulating the activity of the polypeptide described above; (13) methods of treating to requences have antidabated; anorderic, antibacterial, vincled, and antilipaemic activities, and can be used in gene therapy. The corpusement above polypeptide is useful in manufacturing a medicament for treating a pathology associated with the above polypeptide or the nucleic syndrome associated with a human disease. The polypeptide or the nucleic acid molecule may be used to disquence. The polypeptide corpused manufacturing a medicament for treating activities, and can be used and vibracian and polypeptide or or prevent metabolic acid molecule may be used to disquence the polypeptide corpused with a human disease. The polypeptide or probes, in mune disord

The invention relates to isolated NoVX polypeptides and polymucleotides.

NoVX polypeptides and polymucleotides are used to prevent, diagnose or treat a medical condition in human related to the abstrant expression and activity of NoVX polypeptides. For example, NoVX polypeptides and control of NoVX by supplementing the patient our production or to rectify mutations. Conversely, antiense NA molecules may be administered to down regulate expression of NoVX polypeptides by binding with the cells own genes and preventing their expression. NoVX polymucleotides and complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar sequences in samples, and so which patients may be in need of restorative therapy. NoVX polypeptides may also be used as antigens in the production of antibodies and in assays to identify modulators cantinovx polypeptides and antagonists and clivity of NoVX. polypeptides. The anti-NoVX polypeptide antibodies and antagonists may also be used as diagnose and treat: metabolic disorders, diabetes, obesity, infectious diagnose and treat: metabolic disorders, diabetes, obesity, infectious diagnose and treat: metabolic disorders, diabetes, obesity, infectious disorders, Alabeimer's bisease, Parkinson's Disporder, immune disorders, haematopoietic disorders, and the various dyslipidaemias, metabolic disorders, habreimer's bisease, parkinson's and prevent disorders, and the various dyslipidaemias, metabolic wasting disorders associated with obesity, the metabolic syndrome X and charting disorders associated with charcing diseases and various cancer. They may also be used as antibacterial agents. The present sequence of a human NoVX protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Smithson G, Millet I, Peyman JA, Kekuda R, Ju J, Li L, Guo X; Patturajan M, Spytek KA, Edinger SR, Ellerman K, Malyankar UM; Ortr T, Gorman L, Zerhusen BD, Anderson DW, Zhong M, Catterton E; Ji W, Miller CE, Rastelli L, Stone DJ, Pena CEA, Shenoy SG; Shimkets RA, Rothenberg ME, Leach MD, Agee ML, Berghs C, Dipippo VA; Eisen A, Gangolli EA, Rieger DK, Spaderna SK;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Isolated NOVX polypeptides and nucleic acids, useful for preventing, diagnosing and treating e.g. cancer, diabetes and Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 1; SEQ ID NO 96; 395pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

The present invention describes NOVX proteins, where X can be 1 to 55 cengr NOV1). Also described: (1) a composition comprising a polypeptide described above and a carrier; (2) at the composition described above; (3) an isolated nucleic acid containers, the composition described above; (3) an isolated nucleic acid molecule which encodes a NOVX protein of the invention; (4) a vector comprising the nucleic acid molecule described above; (5) a cell like to be peoply peptide described above; (5) a cell like to the polypeptide described above; (7) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a disease associated with altered levels of expression of the above adisease associated with altered levels of expression of polypeptide or nucleic acid molecule in a first mammalian subject; (9) a method of identifying an agent that binds to the polypeptide described above; (10) a method for identifying a potential therapeutic agent for aberrant physiological interactions of the polypeptide or nucleic acid molecule in a first mammalian subject; (9) a construct the polypeptide described above; (11) a method of a pathology that is related to an aberrant expression or a pathology associated with the polypeptide; (12) a method for modulation of a pathology associated with the above polypeptide; (11) a method of producing the above polypeptide is useful in manufacturing a method for producing the above polypeptide is useful in manufacturing a method for producing the above polypeptide or the nucleic and antilipaemic activities, and can be used in gene therapy. The pulpaemic activities, and can be used in gene therapy. The pulpaemic and molecule may be used to diagnose, treat or prevent metabolic acid molecule may be used to diagnose, treat or prevent metabolic dylational and plantacogenerative disorders such as Alzheimer's achexia, cancer, also a diabetes or obseity, inferience and antilibaemic and inference and antilibaemic and inference and an ab
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

New isolated polypeptides, useful for detecting, diagnosing, staging, monitoring, prognosticating, preventing or treating, or determining predisposition to diseases or conditions of the prostate such as prostate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to PS133 protein, a member of the human serine protease family and its corresponding nucleic acid sequence. PS133 polypeptide is useful for detecting, diagnosing, staging, monitoring, prognosticating, preventing or treating or determining predisposition to diseases or conditions of the prostate such as prostatic cancer. The present sequence is the human stratum corneum chymotrypsin protein. This sequence is used to align with PS133 consensus protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

Biochem Biophys, Res. Commun. 211:586-589(1955).

-! FUNCTION: May catalyze degradation of intercellular cohesive structures in the cornilited layer of the skin in the continuous shedding of cells from the skin surface. Specific for amino acid residues with aromatic side chains in the Pl position. SCCE cleaves insulin B chain at 6-Leu-|-Cys-7, 16-Tyr-|-Leu-17, 25-Phe-|-Tyr-26, and 26-Tyr-|-Thr-27, Could play a role in the activation of precursors to inflammatory cytokines.

-!- SUBCELLULAR LOCATION: Secreted. In ovarian carcinoma, secreted and also observed at the apical membrane and in cytoplasm at the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Name=1; Synonyms=Long;
Isod=P49862-1; Sequence=Displayed;
Name=2; Synonyms=Short;
Isold=P49862-1; Sequence=USP 013581;
TISSUE SPECIFICITY: Abundantly expressed in the skin and is expressed by keratinocytes in the epidermia. Also expressed in the brain, mammary gland, cerbellum, spinal cord and kidney. Lower levels in salivary gland, uterus, thymus, thyroid, placenta, trachea and testis. Up-regulated in ovarian carcinoma, especially late-stage serous carcinoma, compared with normal ovaries and benign adenomas (at the protein level).
INDUCTION: By estrogens and glucocorticoids in a breast carcinoma

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
        or infections and catalyze the degradation of intercellular cohesive structures in the cornified layer of the skin in the continuous shedding of cells from the skin surface. Specific for amino acid residues with aromatic side chains in the Pl position. SCCE cleaves insulin B chain at 6-Leu-|-Cys-7, 16-Tyr-|-Leu-17, 25-Phe-|-Tyr-26, and 26-Tyr-|-Thr-27. Could play a role in the activation of precursors to inflammatory cytokines.

-!- SUBCELLULAR LOCATION: Secreted (By similarity).
-!- TISSUE SPECIFICITY: Expressed in skin and, at lower levels, in lung, kidney, brain, heart and spleen. In skin, expressed in high suprabasal keratinocytes and in the luminal parts of hair follicles. Not detected in liver and skeletal muscle.
-!- SIMILARITY: Belongs to the peptidase SI family. Kallikrein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

Lissue kallikrein. Inhibition is achieved by formation of an equimolar, heat- and SDS-stable complex between the inhibitor and the enzyme, and generation of a small C-terminal fragment of the inhibitor due to cleavage at the reactive site by tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     -!- SUBUNIT: Monomer and some homodimers.
-!- SUBCELLULAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Expressed by the liver and secreted in plasma.
-!- PTM: The V-terminus is blocked.
-!- MISCELLANEOUS: Heparin blocks kallistatin's complex formation with tissue kallikrein and abolishes its inhibitory effect on tissue kallikrein's activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Zhou G.X., Chao L., Chao J.; "Kallikrein inhibitor. Sequence 130, Application US/09502600A

Patent No. 6294344
GENERAL INFORMATION:
APPLICANT O'Brien, Timothy J.
TITLE OF INVENTION: Compositions and Methods for the Barly Diagnosis of TITLE OF INVENTION: O'arian Cancer
FILE REPRENENCE: D622301P-C
CURRENT FILING DATE: 2000-02-11
CURRENT PAPLICATION NUMBER: US/09/502,600A
PRIOR PELING DATE: 03-14-1998
NUMBER OF SEQ ID NOS: 136
SEQ ID NO 130
LENGTH: 9
INVERSE PRIOR SEQ ID NOS: 136
SEQ ID NO 130
LENGTH: 9
INVERSE PRIOR SEQ ID NOS: 136
SEQ ID NO 130
FERNISM: Homo sapiens
FEATURE:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         130, App

                                                                                                                              Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence

Patent No. 5972616

GENERAL INFORMATION:

APPLICANT: O'Brite in, Timothy J.

APPLICANT: Tanimoto, Hirotoshi

TITLE OF INVENTION: Breast and Ovarian Carcinomas

FILE REFERENCE: D6064

CURRENT APPLICATION NUMBER: US/09/027,337B

CURRENT FILING DATE: 1998-02-20

NUMBER OF SEQ ID NOS: 13

SEQ ID NO 4

LENGTH: 225

LENGTH: 225
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                OTHER INFORMATION: Serine protease catalytic domain of Scce homologous to OTHER INFORMATION: similar domain in TADG-15

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 19,
